

## ABSTRACT OF THE INVENTION

The invention relates to a reinforced structure of a collapsed  
5 umbrella, which includes a first rib and a second rib being connected with  
a joint. An extended end is formed on the joint to receive the inner end  
of the second rib to increase the strength for resist against wind. A  
reinforced rib connects its inner end with middle portion of the first rib  
and extends its outer end into the joint that prevents the joint from being  
10 twisted and broken.
